#### Introduction

Students face enormous losses in learning due to COVID-19 driven by adaptation to an online learning environment, adaptation to a new physical environment, decreased access to university resources, in addition to personal stressors. The university has an incentive to retain as many students as possible, as evident by their instructions to departments to be understanding of students' situations and the change to a more lenient Pass or No Pass grading policy during Spring, Summer, and Fall 2020. This paper discusses the effect of COVID-19 on course grades and retention at the University of Oregon in Spring and Fall of 2020. We descriptively analyze course grades across department and term to determine if grades increased after COVID-19 despite the decrease in learning. We predict that monetary incentives at the administrative and department level of the university, altruism of instructors, and cheating drive the inflation of grades.

## **Key Findings**

- 1. On average, the median grade across all university courses increased from a B+ to an A- after COVID-19 began.
- 2. Instructor altruism may be driving grade inflation more in departments with lower grade averages.
- 3. Students heavily increased use of P/NP grading option once the policy changed.

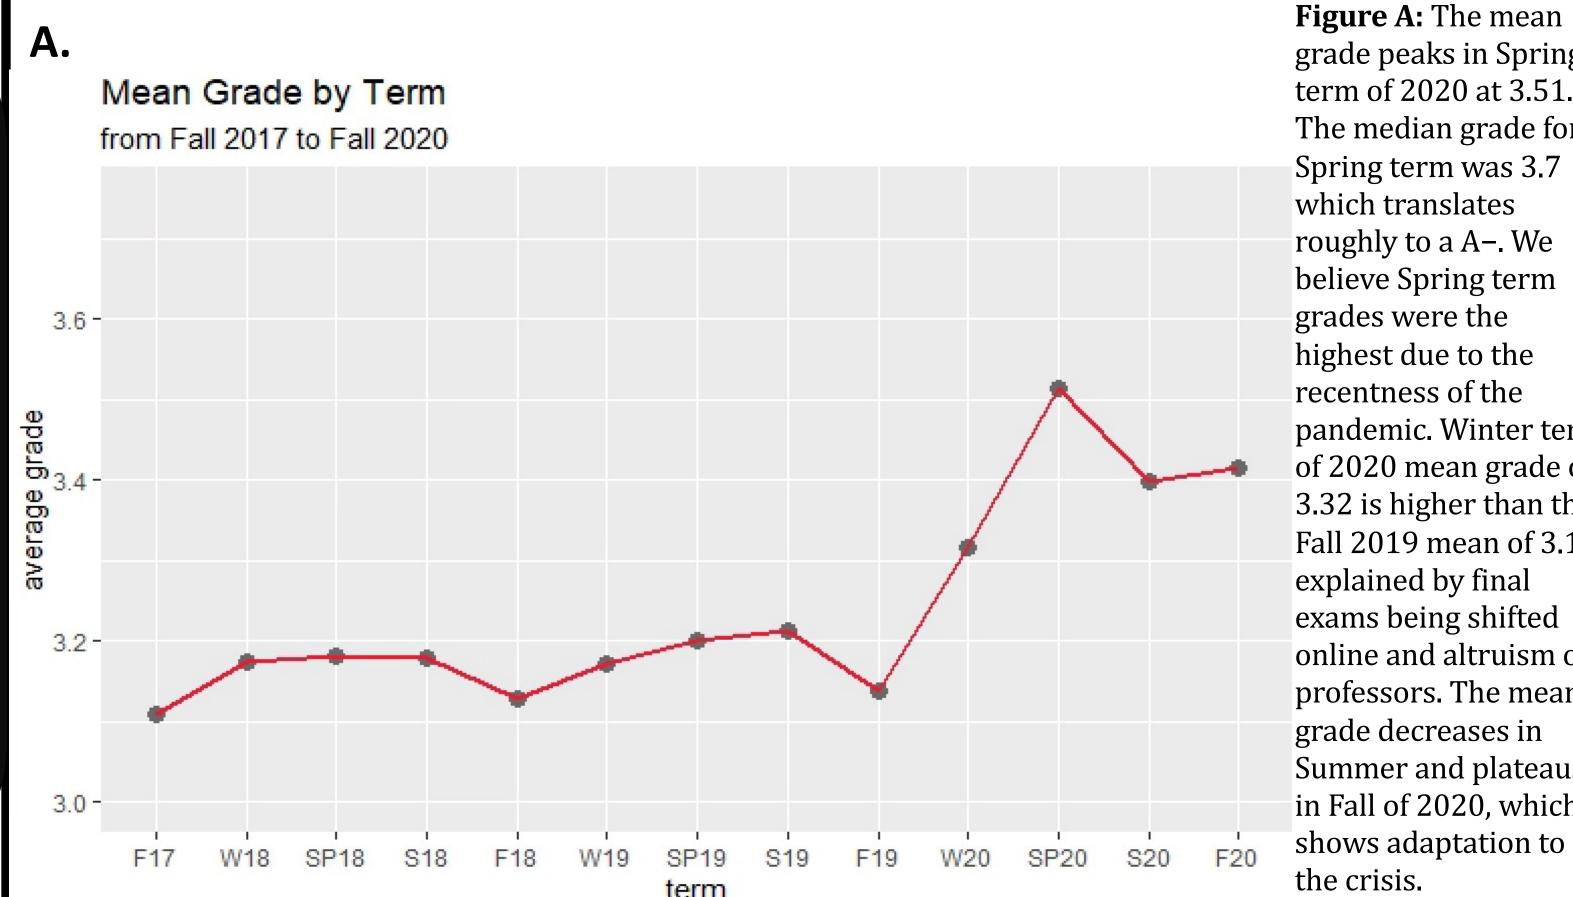

### **Existing Literature**

- Aucejo et al. 2020 used student survey data to construct a subjective treatment effect, finding that 13% of students delayed graduation and 50% expected their GPAs to decrease
- Bird et al. 2020 used a difference-in-difference model to show that the abrupt shift to online learning caused an 8.5% decrease in course completion.
- Figlio et al. 2010 and Alpert et al. 2016 conducted randomized studies that show that students in online courses perform worse in online courses.

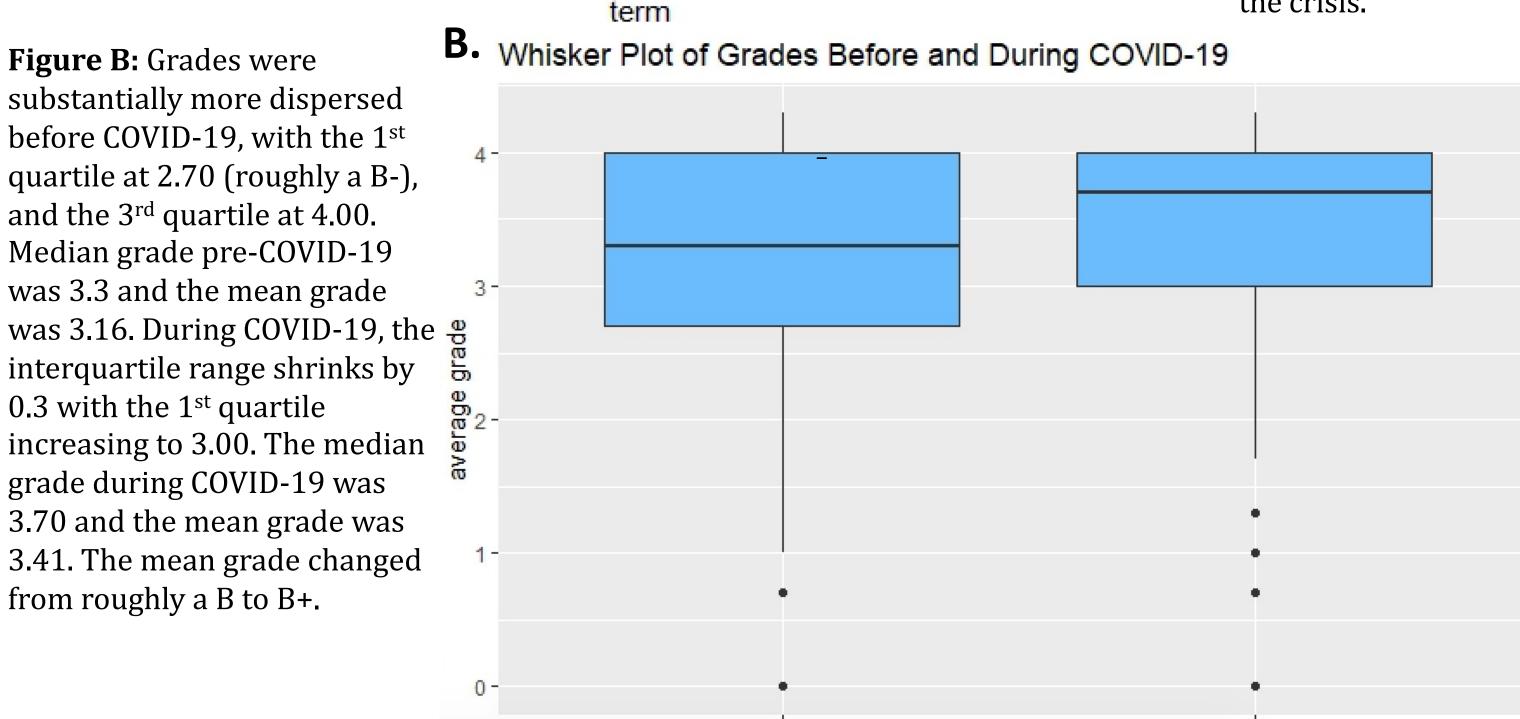

## Methodology

We obtained de-identified data from the University of Oregon Registrar containing course information for each student. We merged this with a dataset containing student information, allowing us to examine retention rate. We created before and after COVID-19 subsets: before COVID-19 contains all entries from Fall 2017 through Winter 2020 and after COVID-19 contains Spring and Fall 2020. Grades are recorded in letter format; where necessary we used a GPA scale to convert letter grades to numeric. Retention was calculated by finding a student's last term and verifying if they graduated; if the student's last term was anything before Fall 2020 and they did not graduate, we marked them as "dropped". The percentage of students dropped is simply the number of students who dropped divided by the total enrollment of that term.

#### **Overall Grade Inflation**

grade peaks in Spring term of 2020 at 3.51. The median grade for Spring term was 3.7 which translates roughly to a A-. We believe Spring term grades were the highest due to the recentness of the pandemic. Winter term of 2020 mean grade of 3.32 is higher than the Fall 2019 mean of 3.14, explained by final exams being shifted online and altruism of professors. The mean grade decreases in Summer and plateaus in Fall of 2020, which shows adaptation to the crisis.

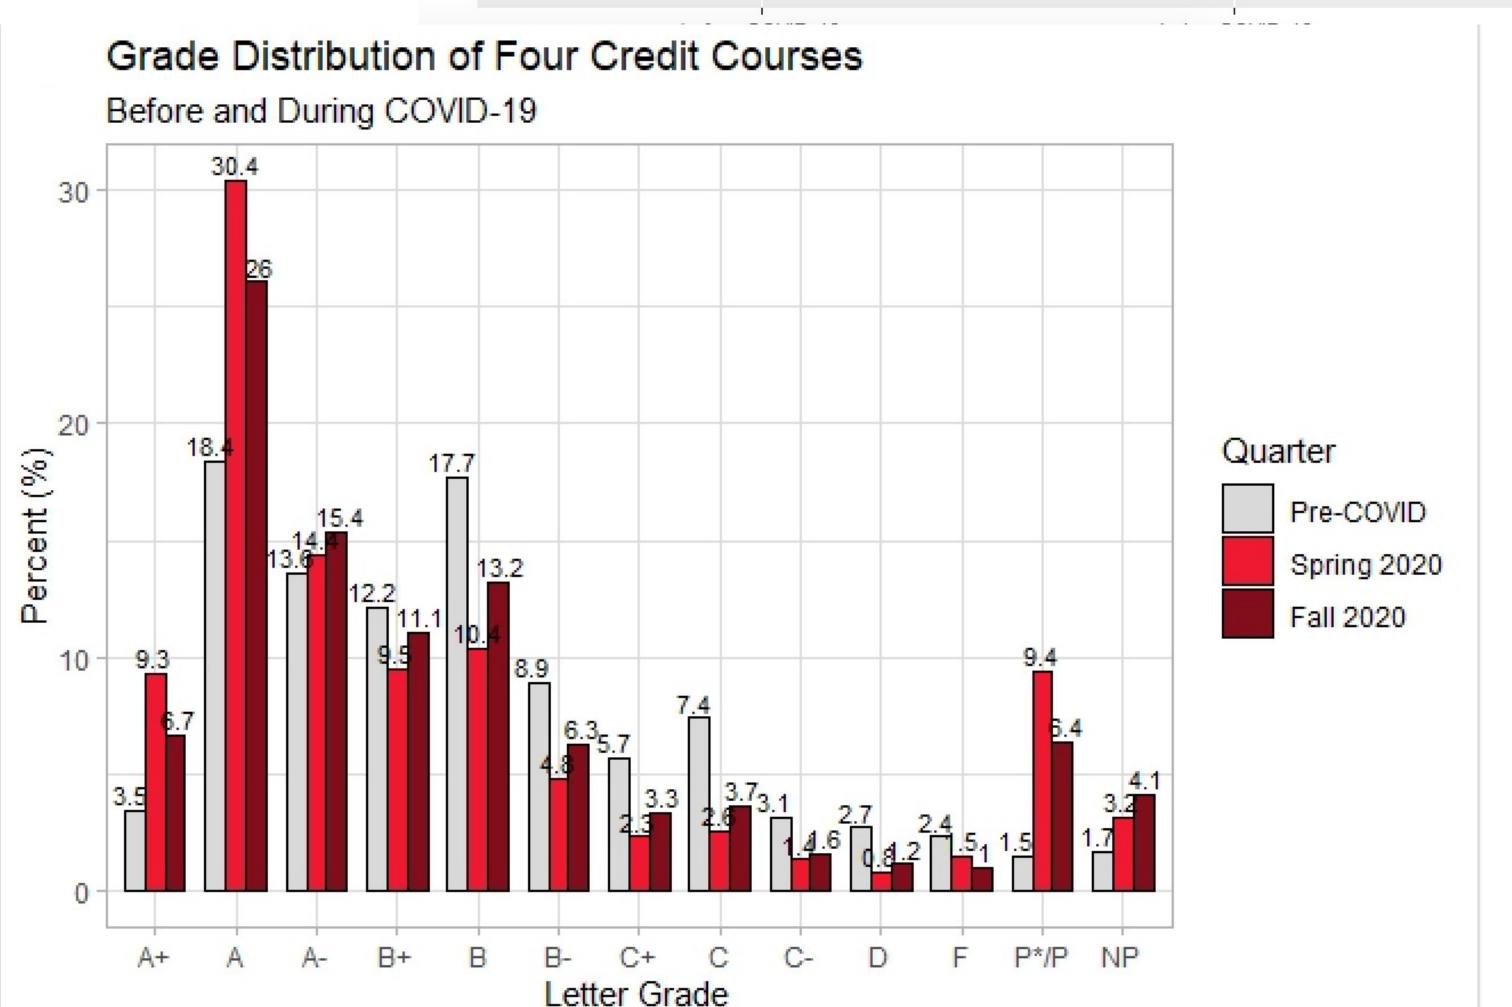

Figure C: Due the grading policy change effective Spring 2020 though Fall 2020, the proportion of P grades increased by 19% or 6.3 percentage points and NP grades by 47%. Notably, the proportion of A's increased 9.9 percentage points or a 65% increase. The highest increase in A's and P's occurred in Spring 2020, matching the plateau of mean grade seen in Figure A.

## Departmental Grade Inflation

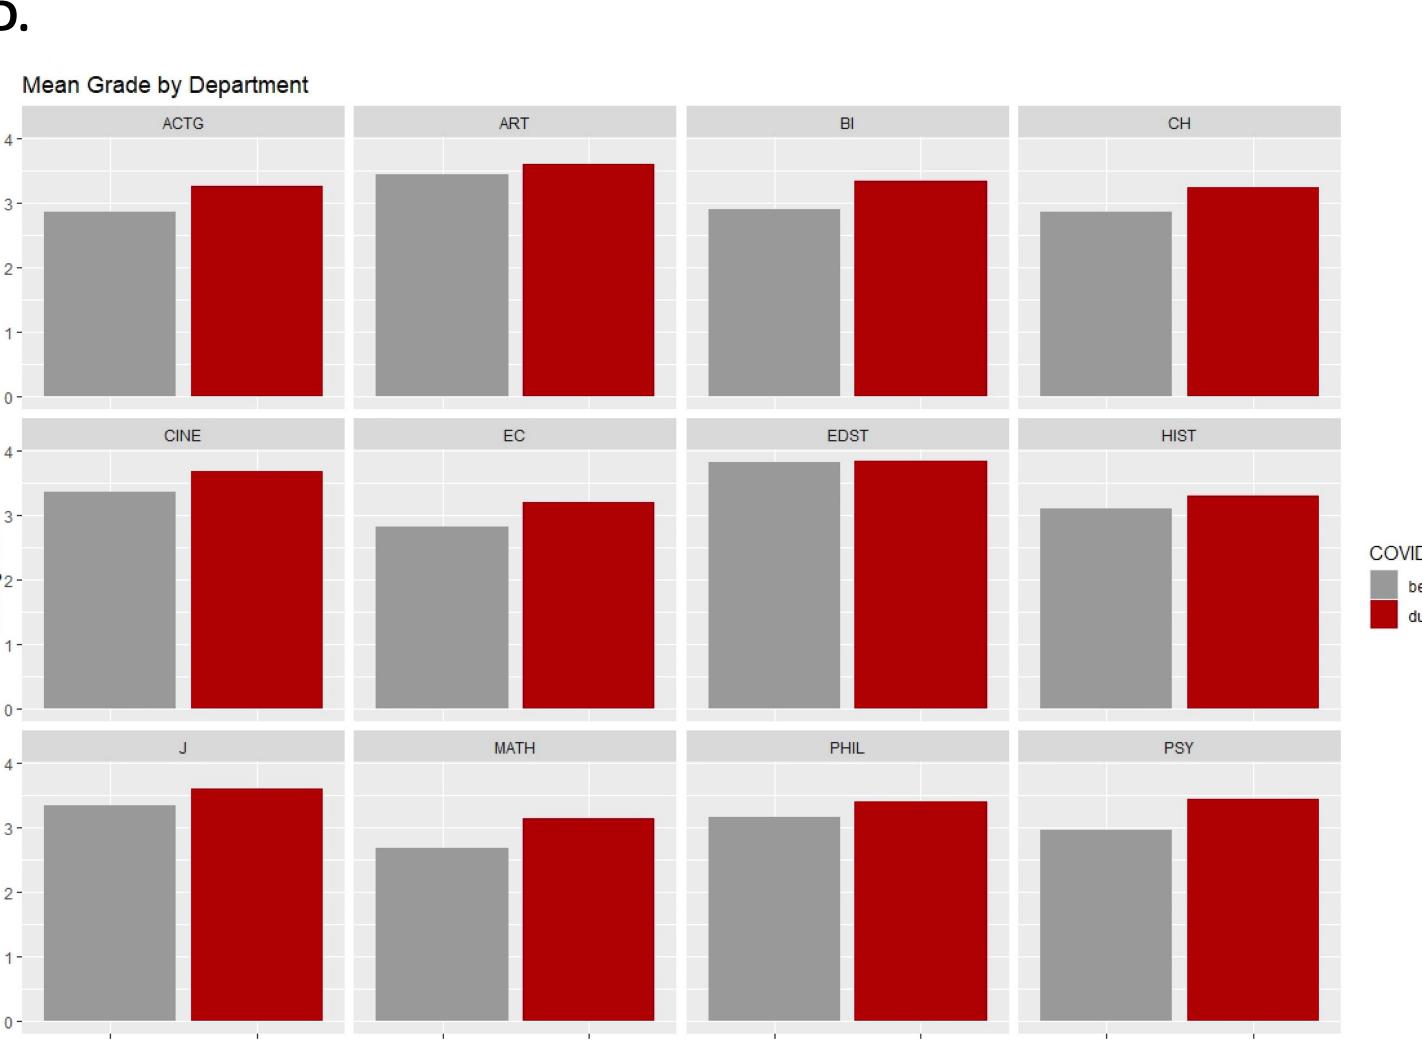

Figure D: When we subdivided mean grades by department, we found that COVID-19 increased grades in all departments, however the increase varied by the mean grade in each department pre-COVID-19. Thus, it seems that mean grades after COVID-19 in departments with lower grades increased substantially more than departments with higher grades pre-COVID-19. For example, the mean grade given in the math courses was a 2.68 pre-COVID-19 and a 3.14 during COVID-19. On the other hand, the Education department (which has the highest GPA at UO) had a pre-COVID-19 mean grade of 3.82 and that increased to a 3.83 during COVID-19. This break down by department shows evidence that altruism on the departmental level and instructor level.

#### Retention

#### Retention Before and During COVID-19 Fall 2018 - Spring 2020 total dropped total enrollment % dropped 17203 Winter '19 647 Spring '19 16640 17808 Fall '19 Winter '20 17010 Spring '20 16297

Figure E: Retention is an important indicator of university and student success. We see a cyclical pattern where the most students drop out in the Spring term. After Spring 2020, 6% of the student population dropped out, likely driven by students' perceptions of the value of online school as well as personal circumstances (e.g. loss of parental income, loss of own income, health emergencies). Retention was also lower in Winter 2020, likely driven by the shock of the crisis however, it seems that most students chose to participate in one term of online school before dropping out.

## Acknowledgements

We would like to thank Bill Harbaugh for giving us direction, motivation, and encouragement. We appreciate your dedication to this project and our learning. Thank you to Garrett Stanford who helped us with wrangling, cleaning, and analyzing in R. We so appreciate the University of Oregon for sharing their data with all undergraduates. Lastly, we thankful to our friends and family who always support us.
